Integer Linear Programming

Input: An integer linear program with k variables.

Parameter: k

Question: Does this ILP have a solution?

This Problem is fixed parameter tractable.

The running time is $f(k)n^{O(1)}$, but the f(k) are painfully large.

▲□▶ ▲□▶ ▲□▶ ▲□▶ ■ ●の00

Proof: very involved...

Input: A graph G and a number k

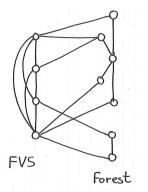

Parameter: k

Question: Are there $\leq k$ nodes whose removal makes G acyclic?

◆□▶ ◆□▶ ◆臣▶ ◆臣▶ □臣 ○のへ⊙

Is FVS fixed parameter tractable?

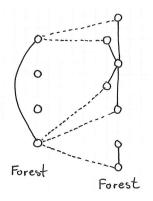

Iterative Compression

Assume we already know a FVS of size k.

Does this help to find a FVS of size k - 1?

(日) (四) (日) (日) (日)

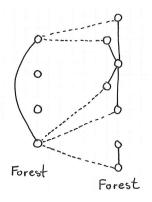

Step 1: Find a subset of the FVS to keep

Plan: Add vertices from the forest to this FVS

ヘロト 人間 とくほとくほとう

э

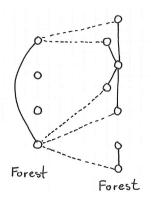

Step 2: Apply reduction rules

Contract components of the FVS into one vertex

(日) (四) (日) (日) (日)

Contract degree-2 vertices in the forest

- Step 3: Branching algorithm
- If a leaf in the forest has two neighbors in the FVS:

ヘロト 人間 ト 人 ヨト 人 ヨト

э

- a) put it into the FVS
- b) delete it and decrease k

Running time

Size of the branching tree 4^k

Total size of all branching trees:

$$\sum_{j=0}^k \binom{k}{j} 4^j = 5^k$$

▲□▶ ▲□▶ ▲ 三▶ ▲ 三▶ 三三 - のへぐ

Total running time $5^k n^{O(1)}$

Depth-First Search Trees

Input: A graph G and a number k

Parameter: k

Question: Is there a path of length k in G?

Construct a depth-first search tree.

What is the helpful property of a DFS tree?

A Simple Theorem

Theorem

Let G be a graph and k a number.

Then it takes only polynomial time to find one of these:

▲□▶ ▲□▶ ▲□▶ ▲□▶ □ のQで

- 1. A cycle of length at least k
- 2. A tree decomposition of treewidth at most k

Proof

k+1 cops slowly traverse the DFS tree

A Simple Theorem

- 1. A cycle of length at least k
- 2. A tree decomposition of treewidth at most k

Proof

k + 1 cops slowly traverse the DFS tree

Long Paths

The theorem allows us to find paths of length k easily:

- 1. If we find a cycle longer than k, there obviously is a path of length k as well
- 2. Otherwise we use the tree decomposition and Courcelle's theorem:

 $\exists x_1 \ldots \exists x_{k+1} (inc(x_1, x_2) \land \cdots \land inc(x_k, x_{k+1}) \land x_1 \neq x_2 \ldots)$

The theorem allows us to find paths of length k easily:

- 1. If we find a cycle longer than k, there obviously is a path of length k as well
- 2. Otherwise we use the tree decomposition and Courcelle's theorem:

 $\exists x_1 \ldots \exists x_{k+1} (inc(x_1, x_2) \land \cdots \land inc(x_k, x_{k+1}) \land x_1 \neq x_2 \ldots)$

Question: Can we solve Vertex Cover this way?

Let G be a graph and k, l some numbers. It takes f(k, l)|G| steps to find one of these:

- 1. A subdivision of the $2 \times k$ grid
- 2. A subdivision of the I-circus graph
- 3. A tree decompositon of G of treewidth $2(k-1)^2(l-1)+1$.

Proof

Again, using a DFS tree.

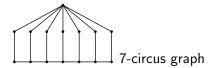

◆□▶ ◆□▶ ◆□▶ ◆□▶ □ ○ ○ ○
